Security In The Cloud – Assignment-1

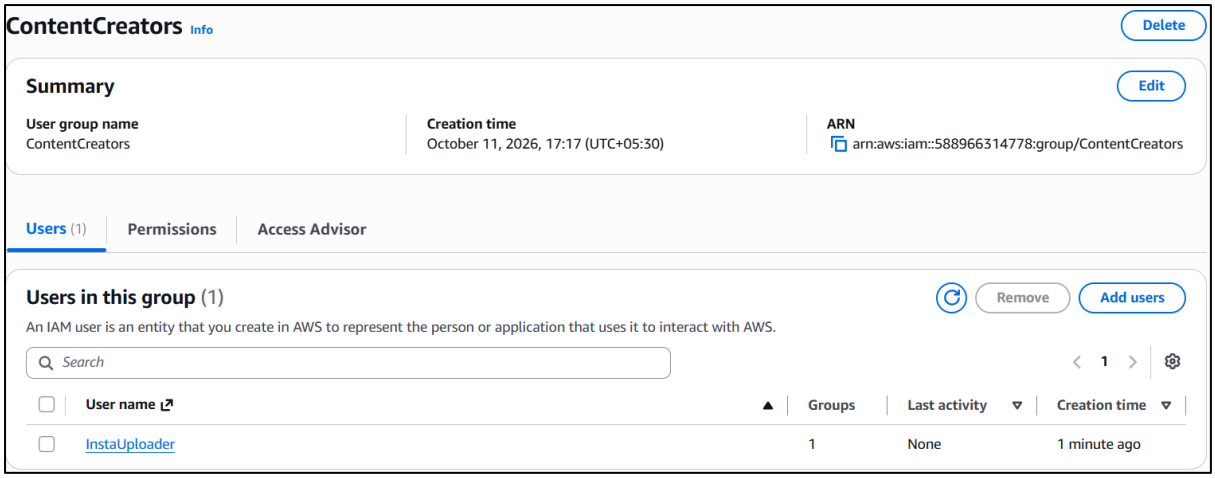

1. Log in to the AWS Management Console and navigate to the IAM dashboard; take a screenshot of the Users section showing the default view.

2. Create a new IAM user named InstaUploader and assign programmatic access only. Download the access key file and note where you saved it. Hint: Do not attach any permissions yet—just create the user and save the credentials.

3. Create a group called ContentCreators in IAM, then add the InstaUploader user to this group.

4. Write a short explanation (3-4 lines) describing the difference between an IAM user and an IAM role, using an example from any app you use daily (e.g., Zomato delivery agent vs. Zomato app admin).

➢ An IAM user represents a specific person who has their own login credentials to access AWS resources. An IAM role provides temporary permissions to a person or service without requiring permanent credentials. For example, in Zomato, an IAM user is like an app admin with their own login, while an IAM role is like a delivery app service temporarily given permission to access order details. Both use permissions to control access securely.
